

HYPOTHESIS TESTING

<h3>Null Hypothesis</h3> <p>A null hypothesis is a statement that a population parameter has a known or specified (claimed) value: $H_0: \mu = \mu_0$</p> <p>That is, the null hypothesis states that a population parameter (in this case μ) is equal to a specific value (which we are calling μ_0 here, i.e. we replace μ_0 with a specific value).</p>		 <p>For any given hypothesis test, we would need to know that the data is usually distributed and the variance.</p> <p>Test Static: For any given hypothesis test, we can calculate our sample test static.</p>		<h3>Hypothesis Testing (H)</h3> <p>Steps:</p> <p>Hypotheses: State the null and the alternative hypothesis in terms of the parameter of interest.</p>	
		<p>p Value: A p-value measures the probability of obtaining a result equal to or more extreme than the observed results, assuming that the null hypothesis is true.</p>		<p>Assumptions</p> <p>Check the underlying assumptions of the test.</p>	
				<p>Test Static</p> <p>Calculate the test static.</p>	
				<p>P-Value</p> <p>Obtain the p-value for the test from the distribution of the test static</p>	
				<p>Decision</p> <p>If the p-value is less than 0.05 (the significance level), reject the null hypothesis. If the p-value is not less than 0.05, do not reject the null hypothesis.</p>	
				<p>Conclusion</p> <p>Write a conclusion to the original research question, in terms of the target population.</p>	
<h3>Large P Value</h3> <p>If the difference between the sample statistic and the null value is small</p> <p>↓</p> <p>The p-value will be large and...</p> <p>↓</p> <p>There will be insufficient evidence against the null hypothesis</p> <p>↓</p> <p>We will not be able to reject H_0</p>		<h3>Small P Value</h3> <p>If the difference between the sample statistic and the null value is increased.</p> <p>↓</p> <p>The p-value will decrease and...</p> <p>↓</p> <p>The evidence against the null hypothesis increase and...</p> <p>↓</p> <p>We reject H_0</p>		<h3>One Numeric Value:</h3> <p>Mean or Median: Present a single statistic that represents your primary data point, such as the average score of a group.</p> <h3>Two Numeric Values:</h3> <p>Comparison Values: Include two related metrics for comparison, such as:</p> <p>"Group A: 80"</p> <p>"Group B: 70"</p> <h3>p-value:</h3> <p>Significance Testing: Provide the results of a p-value test to assess the difference between the two groups:</p> <p>"P-value: 0.03 (indicating a statistically significant difference at the 0.05 level)."</p>	
				<p>Significant Result</p> <p>Using a significance level of 5% (i.e. $\alpha = 0.05$), "if the p-value is less than 0.05, reject H_0". There is evidence against the claim (H_0), so we have a statistically significant result.</p>	
				<p>Non-Significant Result</p> <p>Using a significance level of 5% (i.e. $\alpha = 0.05$), "if the p-value is greater than 0.05, fail to reject H_0". There is no evidence against the claim (H_0), so we have an inconclusive result.</p>
