

# WEEK 1 — TEXT FUNCTIONS

The focus this week was on using Excel functions to manipulate and clean text data. We looked at a lot of different functions. This handy quick reference guide includes all functions we looked at, useful keyboard shortcuts and some other functions worth investigating.

TEXT FUNCTIONS AND OPERATORS		FORMULA TIPS	SHORTCUTS																								
<b>CONCATENATE</b> (text1, text2, ...)	Joins two or more text strings into one string	<ul style="list-style-type: none"><li>Start with =</li><li>Function name always followed by bracket</li><li>Close all brackets</li><li>Comma separate arguments</li><li>Text goes in "quotes"</li><li>Nest multiple functions</li></ul>	<table border="1"><thead><tr><th>Windows</th><th>Mac</th><th></th></tr></thead><tbody><tr><td>Ctrl+C</td><td>⌘+C</td><td>Copy</td></tr><tr><td>Ctrl+V</td><td>⌘+V</td><td>Paste</td></tr><tr><td>Ctrl+S</td><td>⌘+S</td><td>Save</td></tr><tr><td>Ctrl+Z</td><td>⌘+Z</td><td>Undo</td></tr><tr><td>Ctrl+Y</td><td>⌘+Y</td><td>Redo</td></tr><tr><td>Ctrl+N</td><td>⌘+N</td><td>New</td></tr><tr><td>Ctrl+O</td><td>⌘+O</td><td>Open</td></tr></tbody></table>	Windows	Mac		Ctrl+C	⌘+C	Copy	Ctrl+V	⌘+V	Paste	Ctrl+S	⌘+S	Save	Ctrl+Z	⌘+Z	Undo	Ctrl+Y	⌘+Y	Redo	Ctrl+N	⌘+N	New	Ctrl+O	⌘+O	Open
Windows	Mac																										
Ctrl+C	⌘+C	Copy																									
Ctrl+V	⌘+V	Paste																									
Ctrl+S	⌘+S	Save																									
Ctrl+Z	⌘+Z	Undo																									
Ctrl+Y	⌘+Y	Redo																									
Ctrl+N	⌘+N	New																									
Ctrl+O	⌘+O	Open																									
& e.g. =A!&A2&A3	Joins two or more text strings into one string																										
<b>CONCAT</b> (text1, [text2],...)	Combines the text from multiple ranges and/or strings																										
<b>TEXTJOIN</b> (delimiter, ignore_empty, text1, [text2], ...)	Combines text from multiple ranges and/or strings, and includes the option to specify a delimiter																										
<b>LEFT</b> (text, num_chars)	Returns a specified number of characters from the left of a text string.																										
<b>RIGHT</b> (text, num_chars)	Returns a specified number of characters from the right of a text string.																										
<b>MID</b> (text, start_num, num_chars)	Returns a specified number of characters from the middle of a text string.																										
<b>FIND</b> (find_text, within_text, [start_num], [NotFound])	Returns the starting position of one text string within another text string, (is case sensitive)																										
<b>LEN</b> (text)	Returns the number of characters in a text string																										
<b>UPPER</b> (text), <b>LOWER</b> (text), <b>PROPER</b> (text)	Change case to uppercase, lowercase and proper case																										
<b>CLEAN</b> (text)	Removes the first 32 nonprinting characters in the 7-bit ASCII code																										
<b>TRIM</b> (text)	Removes all spaces from text except for single spaces between words																										
<b>SUBSTITUTE</b> (text, old_text, new_text, [instance_num])	Substitutes new_text for old_text in a text string (is case sensitive)																										
		<b>BONUS CONTENT</b>																									
		<b>SEARCH</b> - returns the location of one text string inside another. Unlike FIND, SEARCH allows wildcards, and is not case-sensitive. Syntax: =SEARCH (find_text, within_text, [start_num])																									
		<b>REPLACE</b> - replaces part of a text string, based on the number of characters you specify, with a different text string. Syntax: =REPLACE(old_text, start_num, num_chars, new_text)																									
		You may also want to investigate: <b>CODE</b> , <b>UNICODE</b> , <b>CHAR</b> and <b>UNICHAR</b>																									
		 <b>Text to Columns</b>																									
		You can take the text in one or more cells, and split it into multiple cells using the Convert Text to Columns Wizard
